

SONIC WELD  
NON-WOVEN BAGS

VS

WOVEN BAGS

Sonic weld non-woven bags are made from non-woven fabric that is bonded together using ultrasonic welding. This process uses high-frequency sound waves to create heat and melt the edges of two materials together. The result is a strong, durable bond that is less likely to fail than a stitch.

Regular woven bags are made from woven fabric that is stitched together. The stitching is what holds the bag together and prevents it from coming apart. However, stitching can be weak and can fail, especially if the bag is subjected to a lot of wear and tear.

| FEATURES  |   |   |
|---|---|---|
| Made from non-woven fabric that is bonded together using ultrasonic welding                   | <br><b>CONSTRUCTION</b>      | Made from woven fabric that is stitched together      |
| Stronger and more durable than regular woven bags   | <br><b>STRENGTH</b>         | Not as strong or durable as sonic weld non-woven bags |
| Exceptionally durable   | <br><b>DURABILITY</b>      | Prone to fraying and tearing                          |
| Offer enhanced water resistance   | <br><b>WATER RESISTANT</b> | Susceptible to water penetration                      |
| Can be used for a variety of applications, such as industrial use, food storage, and shipping | <br><b>VERSATILITY</b>     | Not as versatile as sonic weld non-woven bags         |

The best type of bag for you will depend on your specific needs. If you need a bag that is strong, durable, and resealable, then a sonic weld non-woven bag is the best option.
